We strongly recommend:
* You take a backup of your datafile before
attempting any imports.
* You test any import on a copy of your data before
 you do it on the real data.
Don't say you haven't been warned 💙

The Import stock function allows you to import stock into a store after the items have been created (manually or by using the item import function).

This data file already contains items. Please read the manual to make sure

Cancel

Please choose the import text file on the next window

×

 \times

OK

OK

Choose *File > Import > Import stock* from the menus. You will be shown a warning:

you understand what you are doing. Click <Cancel> if you are not sure.

1 mSupply alert

🏚 Alert...

This is telling you to take care! The stock you are importing will be imported on top of the stock you already have in the store you are currently logged into. If you are not sure what you are doing, stop and make sure!

After clicking the **OK** button you will be told the next step is to select the import file:

Click the **OK** button on this window and an operating system window will open for you to select the import file. Find the file and double-click on it or click on it and click the **Open** button.

This window will open:

	Import iter	m and stock				
First line contains column headers						
Remove quote characters on import	Previous	Next	Record number 1			
	Field		Value			
	Code	code				
	Item Name	item_name				
	Units	units				
	Pack size	pack_size				
	Quantity	quantity				
	Cost Price	cost_price				
	Sell Price	sell_price				
	Batch	batch				
	Expiry date	expiry_date				
We recommend you have an up-to-date	Description	description				
backup of your data file before attempting import. Click the cancel button below if you	Department	department				
are not sure.	Location	location				
	Donor					
			Cancel Import r			

- **First line contains column headers checkbox:** Check this by clicking on it if the first line of your file contains the column headers. If this checkbox is checked, mSupply will ignore the first row of the import file and only import from the second row onwards.
- **Remove quote characters on import checkbox:** Check this if you want mSupply to remove quote (") characters from the various fields as it does the import. This is often needed if your import file has come from Excel or another spreadsheet application. You can check if there are unwanted quote characters in the fields using the preview **Next** and **Previous** buttons (see below).
- Next and Previous buttons: Use these to move through the rows in the import file. mSupply will show you the information is is going to import from each field in the import file. You will be shown a warning if you try to view lines before the start or after the end of the file.

If you spot any problems, click on the **Cancel** button, fix them and try again. If all is well, click on the Import button and mSupply will carry out the import. A progress bar will show you how far through the whole process mSupply is. When it gets to the end you will be shown a message telling you how many lines were imported successfully and how many were skipped (because the item could not be identified - because the item code was missing or did not match an item in your datafile).

Import file format

The import file must be a tab delimited text file. The first row can contain the column titles but all other rows in the file should contain data to be imported. These are the fields you should have (and the order they must be in) in each row of the file:

Column	Field	Description
1 (A)	ltem code	Mandatory , Text, up to 18 characters. mSupply uses this to recognise which item this row of stock belongs to. If this code is missing or does not belong to an item already in your datafile, this line of the import file will be skipped.
2 (B)	Item name	Optional , ignored during the import. Text, up to 80 characters. The name of the item, here for reference so you can easily tell which item each row refers to.
3 (C)	Units	Optional , ignored during the import. Text up to 60 characters, for your reference only. The unit the item is to be measured in e.g. Tablet, Each, ml, g, bottle, vial, Ampoule.
4 (D)	Pack size	Mandatory , Integer. The number of units in a single pack for this stock line.
5 (E)	Quantity	Mandatory , Integer. The number of packs (containing the number of units in column 4) in this stock line. Equal to the total quantity if the Pack size is 1.
6 (F)	Cost price	Optional , Real number. The price you pay for one pack.
7 (G)	Sell price	Optional , Real number. The price the customers of this store pay for one pack. Set this to the same as the cost price or leave it empty if you do not actually sell the stock that you issue.
8 (H)	Batch	Optional , Text, Up to 20 characters. The batch of this stock line.
9 (I)	Expiry	Optional , Text, in short format (dd/mm/yy or mm/dd/yy, depending on the format set in your computer's operating system). The date this stock line will expire.
10 (J)	Description	Optional . Text, Up to 32,000 characters. The full description of the item. Be careful not to have any carriage return characters in the text though, or the import file will not be valid!
11 (K)	ltem Department	Optional , Text, up to 30 characters. If you import a department name that doesn't exist, the department will be created.
12 (L)	Shelf Location	Optional , Text, Up to 60 characters. The code for the shelf location of this stock line.
13 (M)	Donor	Optional , Text, Up to 60 characters. The name of the donor of this stock line. If the donor doesn't exist, it will be created.

Please note: It is not part of the import file but, if an item's default Volume per pack is set (see the **Volume per pack** fied on the 4.01.02. Items - Storage tab page for details) then this will be applied as the stock line's volume per pack. The value will be proportianately increased or decreased if the stock line's pack size differs from the item's default pack size (**Preferred pack size** field on the 4.01.02. Items - Storage tab page)

Here is a blank spreadsheet you can use with the right columns:

msupply_stock_import.xlsx

Note: the first row of data in red is an example row - delete it before you import it!

You can create the import file in various ways:

- 1. Manually using the blank template above.
- 2. Manually using any text editor.

Export the current stock from a store in this or another mSupply datafile (and modify it if necessary) and import that.

If you use a spreadsheet application like Excel remember to export the file in Tab delimited text format before trying to import it into mSupply.

You can import as many batches of an item as you wish, there is no limit. And it doesn't matter whether batches of the same item are next to each other in the import file.
