2025/11/17 17:36 1/12 19.09. mSupply REST API

19.09. mSupply REST API

What is it?

mSupply has a REST API that enables certain actions to be carried out externally, by external applications for example. This API allows you to:

- Send an order (response requisition) to mSupply
- Retrieve customer invoices that have been confirmed but not shipped
- Mark a customer invoice as shipped so that it doesn't come in the query for shipped orders

Response requisitions will be processed in mSupply as normal in the supplying store, and can be fulfilled by generating and processing one or more customer invoices, depending on stock availability.

Basic usage

- Communication is over the HTTP protocol. HTTPS is supported and you should use it to keep your passwords and other information secure. If you want to restrict to only HTTPS, then block the HTTP port mSupply is using on your router.
- All data is submitted and returned as JSON.
- You must always login first. This will return a JWT token that you use in further requests to authenticate each request.

The details of the requests you can make and what information you need to send with each request are in the section below.

Authentication

Logins (user name and password) are set up per store as contacts of store names. This uses exactly the same mechanism as customer web ordering. See the 19.03. mSupply customer web interface page for details.

All requests relate to transactions, stock and orders **only** in the store that the user used to authenticate with is a contact of. The customer and supplier's details are derived from the log-in details i.e. the customer will be the store the logged in user is a contact of and the supplier will be the supplying store of that store.

API definition

See the Examples section below for payload details for each request.

Last update: 2024/12/04 17:08

All below URLs should be prefixed with `api/v4`:

URL	HTTP Verb	Description
/login	POST	Login with username and password setup in mSupply. Returns a JWT cookie to be used in following requests (send it in an Authorization header with scheme Bearer i.e. Authorization: Bearer <jwt_token>). Include the loginType = "invoice" element in the request body or, for the /storeCustomerInvoice endpoint, include the loginType = "storeInvoice" element.</jwt_token>
/stock	GET	Returns an array of stock details for all items in the customer's master list(s). * Quantities are specified in number of packs and pack size. * Separate lines for each different batch, expiry date or pack size.
/stock?code=xxx&name=yyy	GET	Returns an array of stock details for all visible items, optionally restricted to those starting with the specified code/name. * Quantities are specified in number of packs and pack size. * Separate lines for each different batch, expiry date or pack size.

2025/11/17 17:36 3/12 19.09. mSupply REST API

URL	HTTP Verb	Description
/customerOrder	POST	Create a new customer order with the supplied array of order lines. Returns the ID of the order created. * The customer and supplier's details are derived from the log-in details i.e. the customer will be the store the logged in user is a contact of and the supplier will be the supplying store of that store. * An order (serial) number will be automatically assigned by mSupply (unique per store). * Item codes must match the codes (the mSupply item code or the catalogue code) of items already existing in mSupply. * Quantities are specified in number of packs and pack size. * Customer orders are created as response (customer) requisitions in mSupply. These are then processed manually in the supplying store to generate one or more customer invoices to fulfil the order (see the 8.07. Stock control methods for your customers (requisitions) page for details). * Customer invoice numbers will also be automatically assigned by mSupply (unique per store). * Generated customer invoices will be linked back to the original customer order via the order number. * Customer invoices are confirmed when the stock has been picked and packed for shipment. * Comments can be entered for the order and also for individual lines.
/customerOrder/{order number}	GET	Return the details of the specified order number.

Last update:	2024/1	12/04	17.08

URL	HTTP Verb	Description
/customerInvoice	GET	Returns an array of customer invoices which have been confirmed but not yet received or cancelled. * Invoices are linked to the original order via the order number. * Quantities are specified in number of packs and pack size. * Prices are per-pack and a line total, with an invoice total which includes any extras (e.g. shipping).
/customerInvoice/{invoice number}	GET	Returns a particular customer invoice. * Invoices are linked to the original order via the order number. * Quantities are specified in number of packs and pack size. * Prices are per-pack and a line total, with an invoice total which includes any extras (e.g. shipping).
/customerInvoiceReceived/{invoice number}	PATCH	Set the specificed customer invoice's received date to the date specified (in ISO format).
/storeCustomerInvoice?startDate=YYYY-MM-DD&endDate=YYYY-MM-DD	GET	Return all confirmed (and not cancelled) customer invoices in the default store of the user logged in with, which were confirmed between the startDate and endDate.
